# Android open source project

- Android is an open-source software stack for a wide range of mobile devices and a corresponding open-source project led by Google
- It's commonly referred as AOSP
- AOSP has 450+ projects
- [www.source.android.com](http://www.source.android.com)

# Welcome to the Android Open Source Project!

Android is an open-source software stack for a wide range of mobile devices and a corresponding open-source project led by Google. Here you can find the information and source code you need to learn more about the Android platform. From there you can create custom variants of the Android software stack, port devices and accessories to the Android platform, and ensure your devices are compatible with the Android compatibility definition.

## WHAT'S NEW

### New CTS media files available for download

Find **CTS media files version 1.1** for Android 5.0 media stress tests on **Compatibility Downloads**.

### Android Partner Marketing offers brand guidance

The Android Partner Marketing team now offers an easy-to-use **Partner Brand Inquiry Form** for answers to branding questions and review of marketing materials.

### Audio gains attributes, USB, latency, and headset documentation

The **Audio** section now describes **Attributes**, **USB digital audio** support, and **latency tools**, while a **Wired audio headset specification** can now be found in the **Accessories** section.

### Encryption and SELinux revised

**Encryption** and **Security-Enhanced Linux** have been updated to describe the latest features of Android 5.0, such as default encryption and full enforcement of SELinux.

## GETTING STARTED

### Explore the Source

Get the complete Android platform and modify and build it to suit your needs. You can also **contribute** to the **Android Open Source Project repository** to make your changes available to everyone else in the Android ecosystem.

### Port Android to Devices

Port the latest Android platform and create compelling devices that your customers want.

### Build Accessories

Sometimes, a device can't do it all. Tap into Android's open accessory standard and build accessories to complement the wide variety of Android-powered devices.

### Get Compatible

Being Android-compatible lets you offer custom features but still give users and developers a consistent and standard experience across all Android-powered devices. Android provides guidance and a test suite to verify your Android compatibility.

# Requirement

- Operating System: Linux (Ubuntu) or Mac
- Environment : 64 bit
- Disk Space for Source : 40 GB
- Disk Space for Build : 100 GB
- Software Requirements :
  - Python 2.6 -- 2.7
  - GNU Make 3.81 -- 3.82
  - JDK 7
  - Git 1.7 or newer

# Repo, Gerrit, Manifest

- **Repo** is a repository management tool that google has built on top of Git. Repo unifies the many Git repositories when necessary, does the uploads to our revision control system.
- **Gerrit** is a web-based code review system for projects that use git. Gerrit encourages more centralized use of Git by allowing all authorized users to submit changes, which are automatically merged if they pass code review
- **Manifest** – A manifest file is an XML file, describing a list of repositories to sync our working directory with.

# Initializing a Build Environment

- Install JDK-7

```
$ sudo apt-get update
```

```
$ sudo apt-get install openjdk-7-jdk
```

- Required package for Ubuntu 14.x

```
$ sudo apt-get install bison g++-multilib git  
gperf libxml2-utils
```

# Install Repo

- Make sure you have a bin/ directory in your home directory and that it is included in your path:

```
$ mkdir ~/bin
```

```
$ PATH=~/bin:$PATH
```

- Download the Repo tool and ensure that it is executable:

```
$ curl https://storage.googleapis.com/git-repo-downloads/repo > ~/bin/repo
```

```
$ chmod a+x ~/bin/repo
```

# Initialization Repo Client

- Create an empty directory to hold your working files. If you're using MacOS, this has to be on a case-sensitive filesystem. Give it any name you like:

```
$ mkdir AOSP
```

```
$ cd AOSP
```

- Run repo “init” to bring down the latest version of Repo with all its most recent bug fixes.

```
$ repo init -u
```

```
https://android.googlesource.com/platform/manifest
```

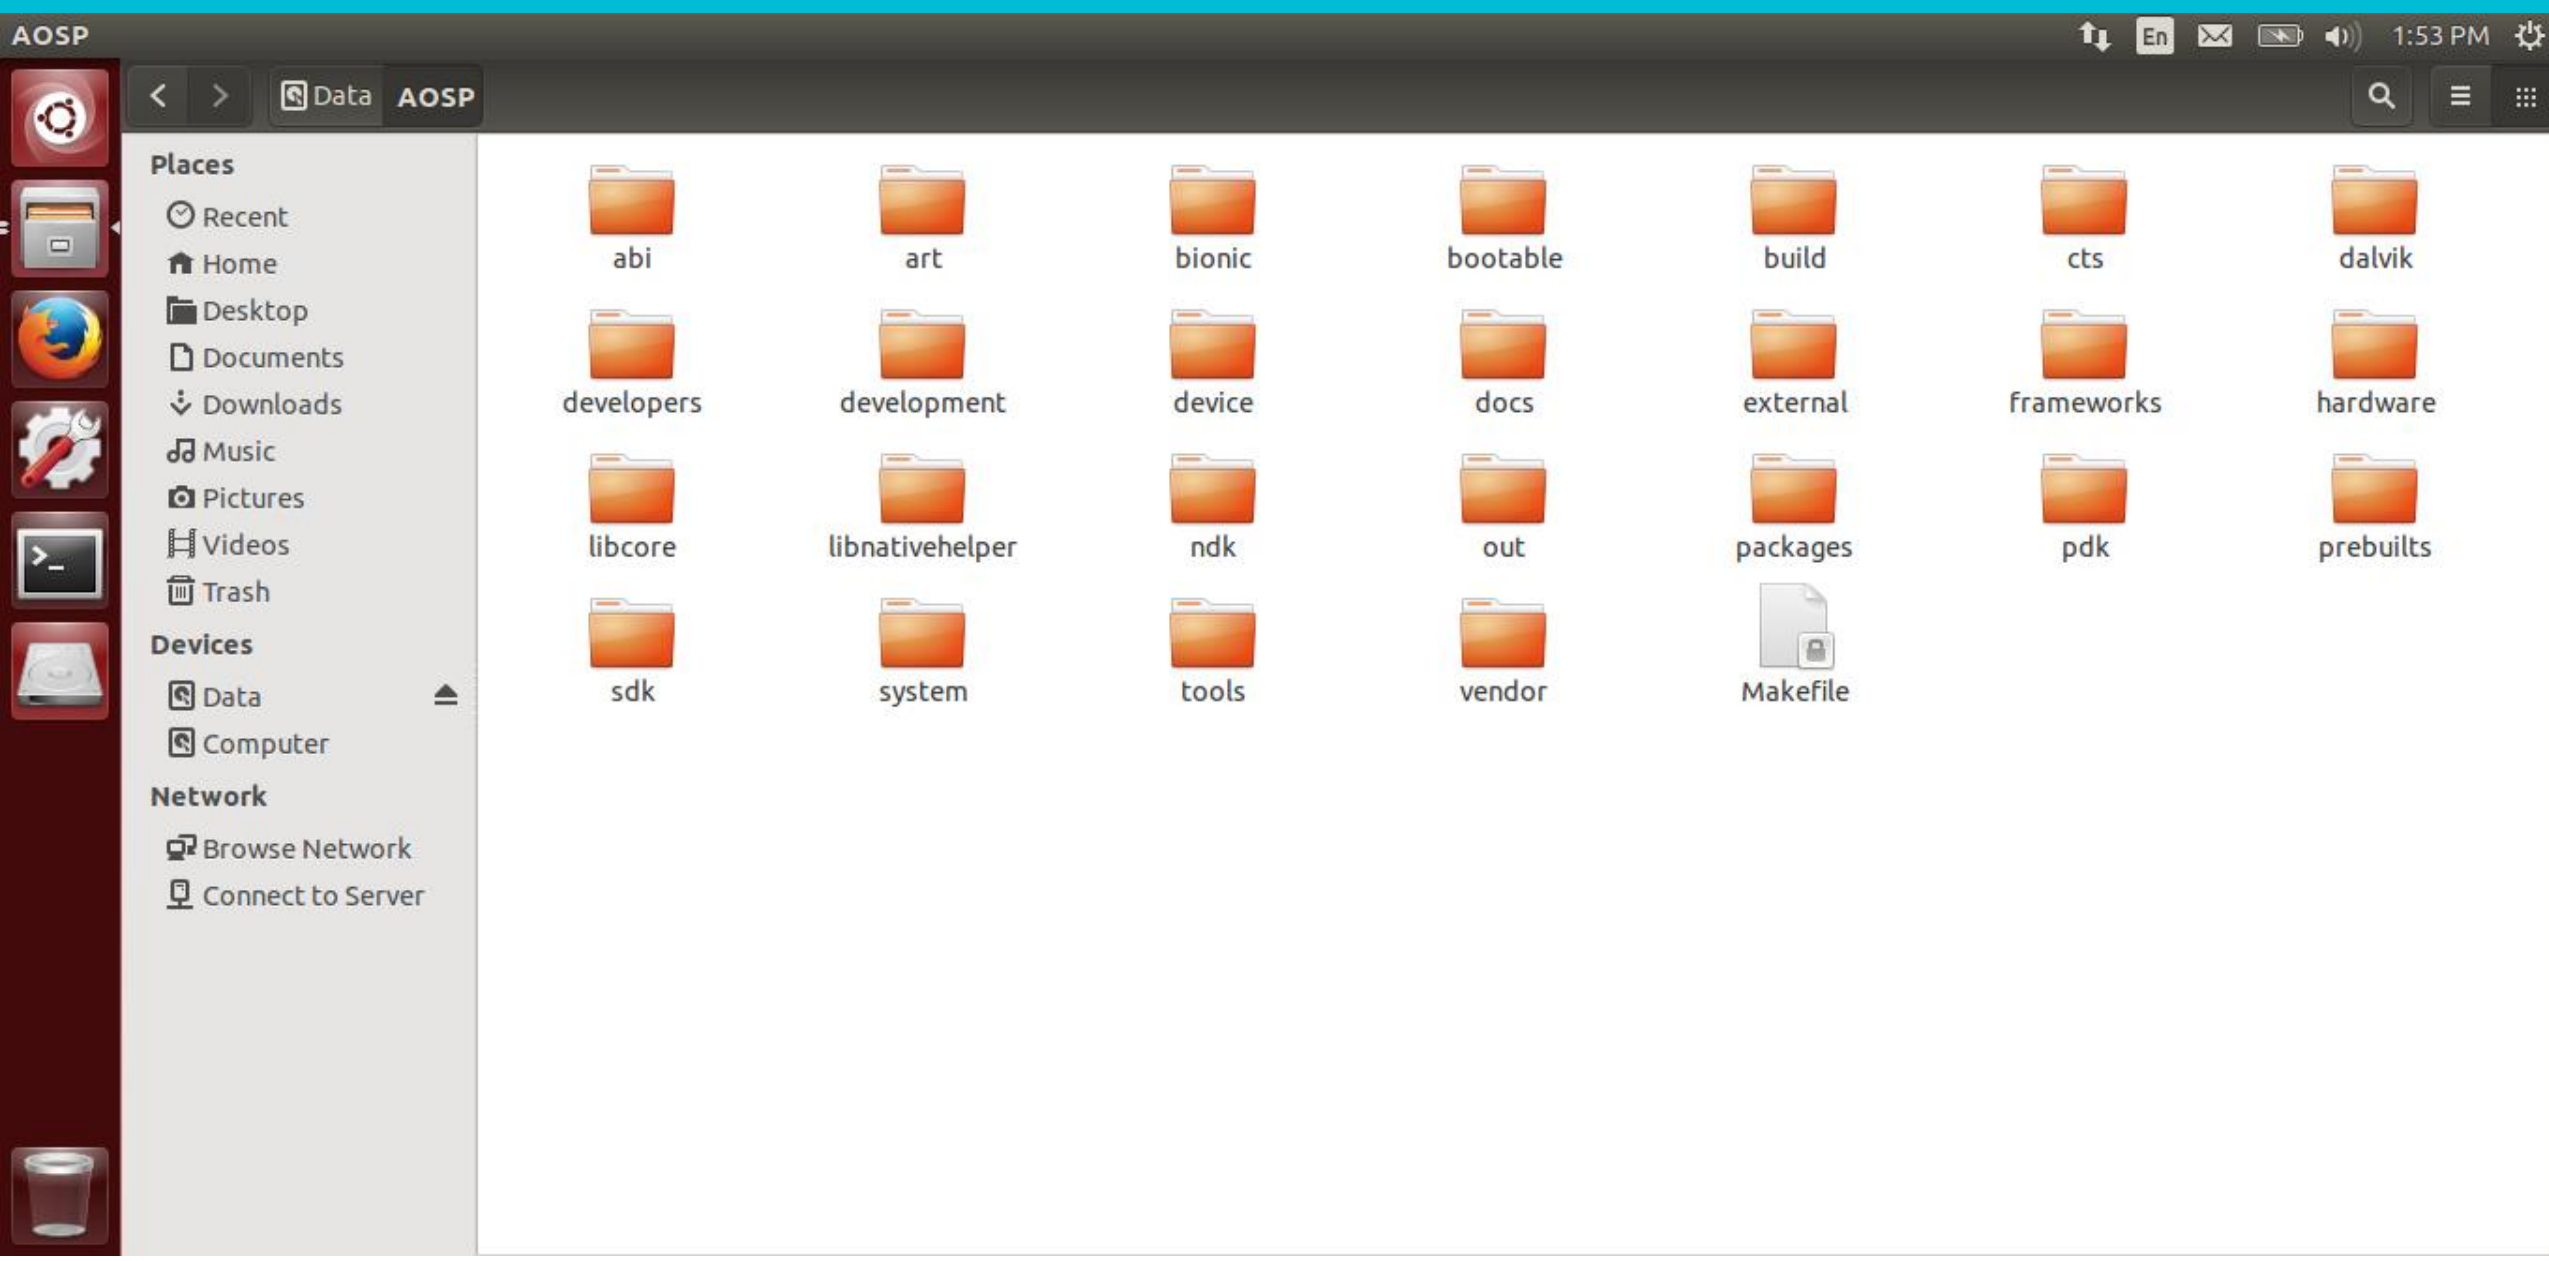

# Download Source Tree

- Download Source Tree

```
$ repo sync -j (--jobs)
```
- It will download almost 40 GB.

# Deep Dive into the Source Tree

# Deep Dive into the Source Tree

- **Bionic** - the C-runtime for Android. Note that Android is not using glibc like most Linux distributions.
- **Bootable** - boot and startup related code.
- **Build** - the build system implementation including all the core make file templates.
- **Cts** - the compatibility tests. The test suite to ensure that a build complies with the Android specification.
- **Dalvik** - the source code for the implementation of the Dalvik Virtual Machine

# Deep Dive into the Source Tree

- **Development** - projects related to development such as the source code for the sdk and ndk tools
- **Device** - product specific code for different devices.
- **External** - contains source code for all external open source projects such as SQLite, Freetype and webkit.
- **Frameworks** - this folder is essential to Android since it contains the sources for the framework. Here you will find the implementation of key services such as the System Server with the Package- and Activity managers.

# Deep Dive into the Source Tree

- **Hardware** - hardware related source code such as the Android hardware abstraction layer specification and implementation.
- **Out** - the build output will be placed here after you run make.
- **Packages** - contains the source code for the default applications such as contacts, calendar, browser.
- **Prebuilt** - contains files that are distributed in binary form for convenience.
- **System** - source code files for the core Android system. That is the minimal Linux system that is started before the Dalvik VM and any java based services are enabled.
